Consensus among computer networks

Abstract: Before Nakamoto consensus it was not practical to assume that one node in a computer network would consistently remain in consensus with the rest of the Network. Today, a node of a Nakamoto network can become certain about consensus information over time. We will present a novel application of BLS threshold signatures that allow for certainly about consensus information in generally two seconds.

Iscrizione all'evento online *da effettuare entro il 17 novembre* tramite il seguente link:
